Spring 2021

Iterators and Iterables

Discussion 5: February 15, 2021

1 Iterators Warmup

1. If we were to define a class that implements the interface `Iterable<Integer>`, what method(s) would this class need to define? Write the function signature(s) below.

`public Iterator<Integer> iterator()`

2. If we were to define a class that implements the interface `Iterator<Integer>`, what method(s) would this class need to define? Write the function signature(s) below.

`public boolean hasNext()`

`public Integer next()`

3. What's one difference between `Iterator` and `Iterable`?

`Iterators` are the actual object we can iterate over. An example of this would be an array - We can iterate through the object in the array.

`Iterables` are object that can produce an iterator that somehow iterate over their contents.

If we have a class called `CS61B`, it itself cannot be iterated over, but it can produce an iterator that iterates over all of the students in the class.

2 OHQueue

The goal for this question is to create an iterable Office Hours queue. We'll do so step by step.

The code below for OHRequest represents a single request. Like an IntNode, it has a reference to the next request. description and name contain the description of the bug and name of the person on the queue.

```

1 public class OHRequest {
2     public String description;
3     public String name;
4     public OHRequest next;
5
6     public OHRequest(String description, String name, OHRequest next) {
7         this.description = description;
8         this.name = name;
9         this.next = next;
10    }
11 }
```

Igmore and skip the bad descriptions

First, let's define an iterator. Create a class OHIterator that implements an iterator over OHRequest objects that only returns requests with good descriptions. Our OHIterator's constructor will take in an OHRequest object that represents the first OHRequest object on the queue. We've provided a function, isGood, that accepts a description and says if the description is good or not. If we run out of office hour requests, we should throw a NoSuchElementException when our iterator tries to get another request.

```

import java.util.Iterator;
public class OHIterator implements Iterator<OHRequest> {
    OHRequest curr;

    public OHIterator(OHRequest queue) {
        curr = queue;
    }

    public boolean isGood(String description) {
        return description != null && description.length() > 5;
    }

    public boolean hasNext() {
        while (curr != null && !isGood(curr.description)) {
            curr = curr.next;
        }
        if (curr == null) {
            return false;
        }
        return true;
    }

    public OHRequest next() {
        if (!hasNext()) {
            throw new NoSuchElementException();
        }
        OHRequest ans = curr;
        curr = curr.next;
        return ans;
    }
}
```

Now, define a class OHQueue. We want our OHQueue to be iterable, so that we can process OHRequest objects with good descriptions. Our constructor will take in an OHRequest object representing the first request on the queue.

```
import java.util.Iterator;
public class OHQueue implements Iterable<OHRequest> {
    OHRequest curr;
    public OHQueue (OHRequest queue) {
        curr = queue;
    }
    public Iterator<OHRequest> iterator() {
        return new OHIterator(curr);
    }
}
```

Fill in the main method below so that you make a new OHQueue object and print the names of people with good descriptions. Note : the main method is part of the OHQueue class.

```
public class OHQueue ... {
    ...
    public static void main(String [] args) {
        OHRequest s5 = new OHRequest("I deleted all of my files", "Allyson", null);
        OHRequest s4 = new OHRequest("conceptual: what is Java", "Omar", s5);
        OHRequest s3 = new OHRequest("git: I never did lab 1", "Connor", s4);
        OHRequest s2 = new OHRequest("help", "Hug", s3);
        OHRequest s1 = new OHRequest("no I haven't tried stepping through", "Itai", s2);
        OHRequest
        for (           X :           ) {
            System.out.println( X.name );
        }
    }
}
```

3 Thank u, next

Now that we have our OHQueue from problem 2, we'd like to add some functionality. We've noticed a bug in our office hours system: whenever a ticket's description contains the words "thank u", that ticket is put on the queue twice. To combat this, we'd like to define a new iterator, TYIterator.

If the current item's description contains the words "thank u," it should skip the next item on the queue, because we know the next item is an accidental duplicate from our buggy system. As an example, if there were 4 OHRequest objects on the queue with descriptions ["thank u", "thank u", "im bored", "help me"], calls to next() should return the 0th, 2nd, and 3rd OHRequest objects on the queue. Note: we are still enforcing good descriptions on the queue as well!

Hint - To check if a description contains the words "thank u", you can use:

```
curr.description.contains("thank u")
public class TYIterator extends OHIterator {
```

```
    public TYIterator(OHRequest queue) {
        Super(queue);
    }
```

```
    public OHRequest next() {
        if (!hasNext()) {
            throw new NoSuchElementException();
        }
        OHRequest ans = curr;
        if (curr.description.contains("thank u")) {
            next();
        }
        curr = curr.next;
        return ans;
    }
```

I think it can also work.

```
    public OHRequest next() {
        OHRequest result = Super.next();
        if (result != null &amp; result.description.contains("thank u")) {
            result = Super.next();
        }
        return result;
    }
```

4 Senior Class Extra

For each line in the `main` method of our `testPeople` class, if something is printed, write it next to the line. If the line results in an error, write next to it whether it is a compile time error or runtime error, and then proceed as if that line were not there.

```

1  public class Person {
2      public String name;
3      public int age;
4
5      public Person(String name, int age) {
6          this.name = name;
7          this.age = age;
8      }
9
10     public void greet(Person other) {System.out.println("Hello, " + other.name);}
11 }
12
13
14 public class Grandma extends Person {
15
16     public Grandma(String name, int age) {
17         super(name, age);
18     }
19
20     @Override
21     public void greet(Person other) {System.out.println("Hello, young whippersnapper");}
22
23     public void greet(Grandma other) {System.out.println("How was bingo, " + other.name + "?");}
24 }
25
26 public class testPeople {
27     public static void main(String[] args) {
28         Person n = new Person("Neil", 12);
29         Person a = new Grandma("Ada", 60);
30         Grandma v = new Grandma("Vidya", 80);
31         Grandma al = new Person("Alex", 70); Compile time error
32         n.greet(a); Hello, Ada
33         n.greet(v); Hello, Vidya
34         v.greet(a); Hello, young whippersnapper
35         v.greet((Grandma) a); How was bingo, Ada
36         a.greet(n); Hello, young whippersnapper
37         a.greet(v); Hello, young whippersnapper
38         ((Grandma) a).greet(v); How was bingo, Vidya
39         ((Grandma) n).greet(v); How was bingo, Vidya
40     } Runtime error
41 }
```
